

# Web x agent x Arbitrum

The dApp reads Heroku for the 8h ETH % and reads the chain for balances. It only writes deposit and withdraw. The keeper, not the website, times Uniswap with the +/- 2% gate.

## Three planes

Agent = pickle/h5 + hourly JSON. Contracts = vault + registry. Website = wallet UI. Never mix keeper keys into Next.js.

## Who calls whom

| From         | To                                       | Web-dev implication                                                 |
|--------------|------------------------------------------|---------------------------------------------------------------------|
| Browser      | GET<br>NEXT_PUBLIC_AGENT_URL/forecasts/* | Poll 30-60s. Render ethPctChange, warmup, action. Never POST infer. |
| Browser      | InferenceRegistry (42161 / 4663)         | useReadContract. Show forecastHash vs API. Link Arbiscan.           |
| User wallet  | ArgonVault.deposit / withdraw            | approve + deposit. Idle-only withdraw in v1.                        |
| Heroku clock | Registry.submit + Vault.rebalance        | Not a frontend job. Dashboard just waits for status chips to flip.  |

## Pages to ship

| Route          | Must show                                                           |
|----------------|---------------------------------------------------------------------|
| /app           | Forecast hero, +/- 2% chip, warmup n/8, four pool cards, hash match |
| /app/deposit   | Chain switch, token amount, approve, deposit                        |
| /app/withdraw  | Idle balances; banner if funds are in range                         |
| /app/forecasts | Last 24h predicted vs realized after hourId+8                       |
| /app/activity  | Deposit, withdraw, Rebalanced events                                |

## Gate the UI must not reinvent

Prefer the API field action. Fallback: warmup if < 8 hours; EXIT if |ethPctChange| >= 2; else ENTER or HOLD. Pools 1 and 4 only. LINK cards stay LINK\_SOON.
